

## **Surface pumps for sandy water**

### **Pumps for special applications**

Our special pumps are sophisticated models developed for transporting specific liquids – e.g. sandy water – and designed for special applications. Depending on the purpose, the materials and design for these pumps may have to satisfy very high requirements.

To pump the sandy water found in various regions, only products developed for this purpose may be used. Given the properties of such liquids, the extremely heavy demands placed on pump materials must be taken into account when these pumps are in development. In addition, many applications require specific equipment for these pumps.

### **Choosing the right special pump**

Our special pumps are categorised by application, enabling you to find the right pump in our product line-up quickly.

### **Transporting sandy water**

Pumping sandy water requires appliances specifically developed for this application. The GPP 2100 M special pump has the necessary technology, robustness and reliability for this purpose. Designed for robustness – with a cast iron housing, peripheral impeller pump hydraulics, an integrated brass impeller and a stainless steel inlay – this pump is ready for immediate operation.
