

## **Special pumps for transporting fuel**

### **Pumps for special applications**

Our special pumps are sophisticated models developed for transporting specific liquids – e.g. heating oil or petrol – and designed for special applications. Depending on the purpose, the materials and design for these pumps may have to satisfy very high requirements.

To pump flammable and corrosive liquids – such as fuel, heating oil or rapeseed oil – only products developed for this purpose may be used. Given the properties of such liquids, the extremely heavy demands placed on pump materials and the safety aspects must be taken into account when these pumps are in development. In addition, many applications require specific equipment for these pumps. If, for example, a special pump is to be used for refuelling aircraft or machines, it should be supplied with the equipment required for this purpose. Hence standard accessories for the MultiOil 35 M special pump include a fuel nozzle and fuel delivery hose.

### **Choosing the right special pump**

Our special pumps are categorised by application, enabling you to find the right pump in our product line-up quickly.

### **Transporting fuels, heating oil and rapeseed oil**

Pumping flammable or corrosive liquids such as diesel fuel, heating oil or rapeseed oil requires appliances specifically developed for this application. The MultiOil 35 M special pump has the necessary technology, robustness and reliability for this purpose. Supplied with a complete and comprehensive set of equipment, this pump is ready for immediate operation. With a fuel nozzle and fuel delivery hose included, it is especially suitable for filling and emptying heating oil tanks as well as refuelling aircraft and machines.
